STATISTICS

Skewness and Kurtosis

Symmetric Distributions

・ロト ・ 四 ト ・ ヨ ト ・ ヨ ト

└─ Symmetric Distributions

A frequency distribution is said to be symmetric if the frequencies are distributed symmetrically or evenly on either side of an average.

In a symmetrical frequency distribution, the number of items above the mean and below the mean would be the same and the items are symmetrically arranged about the mean.

Further, for symmetric distribution,  $Q_3$  and  $Q_1$  are equidistant from median.

└─ Symmetric Distributions

A frequency distribution is said to be symmetric if the frequencies are distributed symmetrically or evenly on either side of an average.

In a symmetrical frequency distribution, the number of items above the mean and below the mean would be the same and the items are symmetrically arranged about the mean.

Further, for symmetric distribution,  $Q_3$  and  $Q_1$  are equidistant from median.

└─Symmetric Distributions

# Skewness means lack of symmetry. The word skewness literally denotes asymmetry.

If a frequency distribution is skewed, there will be more items on one side of the mode than the other side

In the case of a skewed distribution, the mean and the median are pulled away from the mode. That is, for a skewed distribution mean, median and mode are not equal.

(日)

└─ Symmetric Distributions

Skewness means lack of symmetry. The word skewness literally denotes asymmetry.

If a frequency distribution is skewed, there will be more items on one side of the mode than the other side

In the case of a skewed distribution, the mean and the median are pulled away from the mode. That is, for a skewed distribution mean, median and mode are not equal.

└─ Symmetric Distributions

Skewness means lack of symmetry. The word skewness literally denotes asymmetry.

If a frequency distribution is skewed, there will be more items on one side of the mode than the other side

In the case of a skewed distribution, the mean and the median are pulled away from the mode. That is, for a skewed distribution mean, median and mode are not equal.

└─ Symmetric Distributions

### For a skewed distribution Q<sub>1</sub> and Q<sub>3</sub> will not be equidistant from median.

#### It has a long tail on one side and a short tail on the other side.

Most of the economic data have skewed distributions.

#### Example

Income, Savings, etc. have skewed distributions.

・ロト ・ 同ト ・ ヨト ・ ヨト

└─ Symmetric Distributions

- For a skewed distribution Q<sub>1</sub> and Q<sub>3</sub> will not be equidistant from median.
- It has a long tail on one side and a short tail on the other side.

Symmetric Distributions

### +VE and -VE Skewness

#### -Symmetric Distributions

- Skewness may be either positive or negative.
- Skewness is said to be positive when mean is greater than median and median is greater than mode. In this case the curve is skewed to the right.
- Here more than half the area falls at the right side of the highest ordinate.
- Skewness is said to be negative when mean is less than median and median is less than mode (the curve is skewed to the left).
- Here more than half the area falls at the left of the highest ordinate.
- For a positively skewed longer tail at the right and for a negatively skewed curve, tail at the left.

- Skewness may be either positive or negative.
- Skewness is said to be positive when mean is greater than median and median is greater than mode. In this case the curve is skewed to the right.
- Here more than half the area falls at the right side of the highest ordinate.
- Skewness is said to be negative when mean is less than median and median is less than mode (the curve is skewed to the left).
- Here more than half the area falls at the left of the highest ordinate.
- For a positively skewed longer tail at the right and for a negatively skewed curve, tail at the left.

- Skewness may be either positive or negative.
- Skewness is said to be positive when mean is greater than median and median is greater than mode. In this case the curve is skewed to the right.
- Here more than half the area falls at the right side of the highest ordinate.
- Skewness is said to be negative when mean is less than median and median is less than mode (the curve is skewed to the left).
- Here more than half the area falls at the left of the highest ordinate.

- For a positively skewed longer tail at the right and for a negatively skewed curve, tail at the left.

## IST MEASURE OF SKEWNESS

#### KARL PEARSON'S COEFFT.

Karl Pearson's Coefficient 'J' =  $\frac{1}{2}$ 

In case, if in a frequency distribution, the Mode is ill defined, then Mean-Mode is taken as 3(Mean-Median)

#### IF MODE ILL DEFINED

$${}^{\prime} {\sf J}' = {3({\it Mean-Median})\over {\it StandardDeviation}}$$
 ; value of 'J' will be -3 < J > 3

└─<sub>Mesures of Skewness</sub>

2ND MEASURE OF SKEWNESS(BOWLEY'S COEFFT.)

Bowley's coefft. 'J' 
$$= \frac{(Q_3 + Q_1 - 2M)}{Q_3 - Q_1}$$

Where 'M' is the Median.

THIRD MEASURE OF SKEWNESS(KELLY'S COEFFT.

Where 'D' stands for decile and 'P'stands for Percentile.

Mesures of Skewness

2ND MEASURE OF SKEWNESS(BOWLEY'S COEFFT.)

Bowley's coefft. 'J' 
$$= \frac{(Q_3 + Q_1 - 2M)}{Q_3 - Q_1}$$

Where 'M' is the Median.

THIRD MEASURE OF SKEWNESS(KELLY'S COEFFT.)

$${}^{`}\mathsf{J}{}^{`}=rac{(D_9+D_1-2 \;\textit{Median})}{(D_9-D_1)} \; ext{or} \; rac{(P_{90}+P_{10}-2 \;\textit{Median})}{(P_{90}-P_{10})}$$

Where 'D' stands for decile and 'P'stands for Percentile.

イロト イポト イヨト イヨト

Mesures of Skewness

#### FOURTH MEASURE OF SKEWNESS

On the basis of central moments, Coefficient of skewness is given by 'J' =  $\frac{\mu_3}{\sqrt{\mu_2^2}}$ 

Where  $\mu_3$  and  $\mu_2$  are third moment and second moment respectively.

#### CENTRAL MOMENT $\mu_r$

Central Moment ' $\mu_r$ ' =  $\frac{\sum (x - \bar{x})^r}{n}$  for individual series and  $\frac{\sum f \times (x - \bar{x})^r}{N}$  for a frequency distribution.

Mesures of Skewness

#### Fourth Measure of Skewness

On the basis of central moments, Coefficient of skewness is given by 'J' =  $\frac{\mu_3}{\sqrt{\mu_2^2}}$ 

Where  $\mu_3$  and  $\mu_2$  are third moment and second moment respectively.

#### Central Moment $\mu_r$

Central Moment '
$$\mu_r$$
' =  $\frac{\sum (x - \bar{x})^r}{n}$  for individual series and  $\frac{\sum f \times (x - \bar{x})^r}{N}$  for a frequency distribution.

# The term 'Kurtosis' indicates whether a distribution is flat topped or peaked.

Measure of Kurtosis is therefore measure of peakedness.

#### MESOKURTIC

When a curve is neither peaked nor flat topped, it is called mesokurtic(normal).

イロト イポト イヨト イヨー

The term 'Kurtosis' indicates whether a distribution is flat topped or peaked.

Measure of Kurtosis is therefore measure of peakedness.

#### MESOKURTIC When a curve is neither peaked

mesokurtic(normal).

The term 'Kurtosis' indicates whether a distribution is flat topped or peaked.

・ ロ ト ス 戸 ト ス ヨ ト ス ヨ

Measure of Kurtosis is therefore measure of peakedness.

#### MESOKURTIC

When a curve is neither peaked nor flat topped, it is called mesokurtic(normal).

└─Measures of Kurtosis

#### LEPTOKURTIC

When a frequency curve is **more peaked** than the normal curve it is called **leptokurtic**.

#### Platykurtic

When a frequency curve is **more flat topped** than the normal curve, it is called **platykurtic**.

└─ Measures of Kurtosis

#### LEPTOKURTIC

When a frequency curve is **more peaked** than the normal curve it is called **leptokurtic**.

#### PLATYKURTIC

When a frequency curve is **more flat topped** than the normal curve, it is called **platykurtic**.

・ロト ・ 同ト ・ ヨト ・ ヨト

└─Measures of Kurtosis

### Measure of Kurtosis

Measure of Kurtosis is derived from moments.

Measure of Kurtosis '
$$\beta_2$$
' =  $\frac{\mu_4}{(\mu_2)^2}$ 

### $\sim$

When  $\beta_2 = 3$ , the distribution will be mesokurtic, if it is lower than 3, the distribution is platykurtic and if it is greater than 3, it is leptokurtic.

└─Measures of Kurtosis

### MEASURE OF KURTOSIS

Measure of Kurtosis is derived from moments.

Measure of Kurtosis '
$$eta_2$$
'  $= rac{\mu_4}{(\mu_2)^2}$ 

When  $\beta_2 = 3$ , the distribution will be mesokurtic, if it is lower than 3, the distribution is platykurtic and if it is greater than 3, it is leptokurtic.
